1) Explain the difference between SSD, RAM, anc cache memory:

- An SSD (Solid State Drive) is able to permanently store files, OS, and program.
- RAM (Random Access Memory) - RAM holds temporary data of programs during
- Cache memory - located in the computers processor and holds frequently used data and instructions.

2) What is the difference between a compiled programming language and an interpreted programming language?

- Complied programming language - translates the entire code to machine language before it is able to execute, requires you to recompile every time you want to test the program.
- Interpreted programing language - executes the code line by line, easier testing, and slower.

Problem 3

```
score1 = int(input("Enter the first exam score: "))
score2 = int(input("Enter your second exam score: "))

average = score1 +score2 / 2
```

- This program contains a logic error. The program doesn't output any result due to missing 'print(average).' It also won't produce the correct average due to the order of operations.

```
score1 = int(input("Enter the first exam score: "))

score2 = int(input("Enter your second exam score: "))

average = (score1 + score2) / 2

print('average')
```
